**Door Lock - Quick Install Guide**

*For additional installation details please see manufacturer instructions inside box.

**Important Information:**
- You or Your contractor are ultimately responsible for any installation work You or they perform. Per the terms of your AT&T Digital Life Customer Agreement, You have agreed not to make any claim against AT&T relating to installation that is performed by You or Your contractor.
- The lock is packed based on how it will install on the door.
- Have all device parts nearby.
- Determine location(s) where door locks will be installed.

**Step 1.** Install bolt in door. Lock should be in a retracted (unlocked) position when installing the lockset.

**Step 2.** Install strike on the door frame - bolt needs to be centered in the strike.

**Step 3.** Insert outside escutcheon while routing cable through inside mounting plate’s 1/2” hole; insert mounting plate tongue into bottom slot of outside escutcheon and tailpiece through bolt.

**Step 4.** Route the cable through the 2-1/8” diameter hole. **Note:** Wired harness goes under bolt.

**Step 5.** Secure inside mounting plate to outside escutcheon using two (2) M6 x 59.5mm pan head machine screws. Do not over-tighten.

**Step 6.** Attach cable connector to inside escutcheon circuit board. Press firmly with thumbs to ensure back edge wires of the connector line up with arrows on the printed circuit board.

**Step 7.** Install inside escutcheon on inside mounting plate - as you insert the inside escutcheon, thumb turn should be vertical. Slide the escutcheon over the mounting plate. Do not pinch cable during assembly.

**Step 8.** Install and secure using three (3) M4 x 8mm pan head screws through the battery housing into the mounting plate.

**Step 9.** Install the Z-Wave module with the angled edge up; make sure it seats securely on the connector.
